Patent No. 6110672

GENERAL INFORMATION:

APPLICANT: Mandel, Gail

APPLICANT: Halegoua, Simon

APPLICANT: Borden, Laurence A.

TITLE OF INVENTION: Peripheral Nervous System Specific

TITLE OF INVENTION: X-ray Diffraction, Computer Molecular Modeling, Rational

TITLE OF INVENTION: Thereof

NUMBER OF SEQUENCES: 19

CORRESPONDENCE ADDRESS:

/note==Vector: pME18S-FL3; Site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCANGTG): 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCCTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor!
[TGTTGGCCTAGG], digested and cloned into distinct DraIII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the CDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sumio Sugano
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Kolchi Kawakami. Custom primers for
sequenocing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCAGCAC.

stage of the pME18S-FL3 vector.

sequenocing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCAGCAC.

stage of the pME18S-FL3 vector.

stage of the pME18S-FL3 vector.

sequenocing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCAGCAC.

stage of the pME18S-FL3 vector.

stage of the pME

CDNA Library Preparation: M.B. Soares Lab Clone distribution:
Researchers may obtain BMMP cDNA clones from RESEARCH GENETICS. It
should be noted that Bento Soares is generating a small number of
additional specialized non-redundant arrays of BMMP cDNAs whose
availability will be considered under appropriate and limited
collaborative arrangements
Seq primer: M13 Reverse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 547)

NIH_BWAP_M_S2; NIH_BWAP_M_S1. The subtracted library (NIH_BWAP_M_S4) was constructed as follows: PcRamplified cDNA inserts from NIH_BWAP_M_S3.3, NIH_BWAP_M_S3.2, and NIH_BWAP_M_S3.1 clones from which 3' ESTS had been derived was used as a driver in a hybridization with a pool of the NIH_BWAP_M_S3.3, NIH_BWAP_M_S3.2, and NIH_BWAP_M_S3.1 libraries in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DHIOB bacteria (LifeTechnologies) to generate the NIH_BWAP_M_S4 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research
                                                                                                                                                                                                                                                                                                                                                                                ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      BG578677 518 bp mRNA EST 11-APR-2001 dac36c11.yl NICHD XGC Hel Xenopus laevis cDNA clone IMAGE:4409085 5' similar to TR:Q62242 Q62242 SODIUM CHANNEL ;, mRNA sequence.

Library constructed by Life Technologies. DNA Sequencing by:
Library constructed by Life Technologies. DNA Sequencing by:
Washington University Genome Sequencing Center.
Clone distribution: Xenopus clones from this library are available
through the I.M.A.G.E. Consortium/LINE at: info@image.llnl.gov
Seq primer: -40RP from Gibco
High quality sequence stope: 392.

                                                                                                                                                                     ö
                                                                     The present sequence represents rat sensory neurone specific 2a (SNS-2a) SNS-2a is a sodium channel protein. SNS-2a can be used in a method for the identification of a modulator of a sodium channel, and for assaying for compounds which modulate sodium flux. The sodium channel modulators can be used in a medicament for the treatment of pain or hypersensitivity.
                                                                                                                                                                                                                                                                                                                                  300
                                                                                                                                                                                                                                                                                                                                                                 360

The protein is a sodium ion channel of the nervous system, and is highly expressed in plexiform and dorsal root gangila. The protein can be used to identify inhibitors of sodium channel proteins that are resistant to tetrodotoxin (TTX). The inhibitors are potentially useful for treating epilepsy, stroke, diabetic neuropathy, traumatic injuries, AIDS-related neuropathy, and especially neuropathic pain, e.g. migraine and

This is the predicted amino acid sequence of the rat NaN channel, as deduced from isolated rat NaN CDNA (see AAX87600). NaN is a previously unidentified voltage gated sodium channel protein that is previously unidentified voltage gated sodium channel protein that is preferentially expressed in dorsal root ganglia (DRG) or trigeminal ganglia, and which produces a TTX-R sodium current. The impose and human NaN nucleic acids (see AAX87600-02) and polypeptides (see AAX87600-02) and polypeptides (see AAX87600-02) and polypeptides (see AAX87600-02) and collypeptides expression vectors and transformed host cells, methods for identifying spanets that modulate NaN channel activity or NaN channel mRNA transcription or translation, and a method for using such agents to treat acute or chronic pain, paraesthesia and channel mRNA transcription or translation, and a method for using such agents to treat acute or chronic pain, paraesthesia and spensory DRG and trigeminal neurons provides a target for selectively modifying the behaviour of these nerve cells while not affecting other nerve cells in the brain and spinal cord. 91pp; English 2A-C; 1; $\overset{\pi}{\times}\overset{\circ}{\times}\overset{\circ}{\circ}{\circ}\overset{\circ}$

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Domain
AAB20122
```

```
The present sequence is that of novel rat tetrodotoxin resistant sodium channel NaN, as deduced from CDNA (see AAF30102) isolated from a rat dorsal root ganglia tissue library. The sequence shows 69% similarity to human NaN (see AAB20121). NaN belongs to the a-subunit voltage-gated sodium channel protein family. It produces a TYX R sodium current. Such channels underlie the generation and propagation of impulses in excitable cells such as neurons and muscle fibres. Preferential expression of NaN on sensory neurons innervating the body (dorsal root ganglia) and the face (trigeminal ganglia), but not on other neurons, makes it a very useful target for diagnostic and/or therapeutic uses it a very useful target for diagnostic and/or therapeutic uses in relation to acute and/or chronic pain pathologies. A claimed method of treating pain, paraesthesia and/or hyperexcitability phenomena in a human or animal subject involves administering an expense that alters sodium current flow through NaN channels, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LMIRISVHSVFSMFIICTVIINCMFMANSMERSFDNDIPEYVFIGIYILEAVIKILARGF 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MEERYYPVIFPDERNFRPFTSDSLAAIKKRIAIQKERKKSKDKAAAEPQPRPQLDLKASR 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecules encoding human tetrodotoxin resistant sodium channels, useful for preventing, diagnosing and treating pain, paraesthesia and/or hyperexcitability phenomena -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               which modulates transcription or translation of Nan MRNA, in dorsal root ganglia or trigeminal neurons. Nan polypeptides can be obtained by recombinant expression, and used to treat disorders associated with decreased sodium channel expression, to screen for compounds that modulate sodium channel expression or activity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 1765;

and the second

```
The present sequence is that of novel rat tetrodotoxin resistant sodium channel NaN, as deduced from cDNA (see AAP30102) isolated from a rat dorsal root ganglia tissue library. The sequence shows 69% similarity to human NaN (see AAB20121). NaN belongs to the a-subunit voltage-gated sodium channel protein family. It produces a TTX-R sodium current. Such channels underlie the generation and propagation of impulses in excitable cells such as neurons and muscle fibres. Preferential expression of NaN on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecules encoding human tetrodotoxin resistant schannels, useful for preventing, diagnosing and treating pain, paraesthesia and/or hyperexcitability phenomena
                                                                                                                                                                                                                                                     note= "transmembrane domain DIII-SS1"

the face (trigominal gangia), but not on other neurons, makes it a very useful target for diagnostic and/or therapeutic uses in relation to acute and/or chronic pain pathologies. A claimed method of treating pain, paraesthesia and/or hyperexcitability phenomena in a human or animal subject involves administering an agent that alters sodium current flow through NaN channels, or which modulates transcription or translation of NaN mRNA, in be obtained by recombinant expression, and used to treat disorders associated with decreased sodium channel expression, to screen for compounds that modulate sodium channel expression, to screen for and to raise antibodies useful as diagnostic agents. ~ DO DO DO DO DO DO X O ...

השנבובונ מכום molecules encoding human tetrodotoxin resistant s channels, useful for preventing, diagnosing and treating pain, paraesthesia and/or hyperexcitability phenomena -

Example 3; Fig 7B; 162pp; English

The present sequence is that of novel mouse tetrodotoxin resistant solium channel NaN, as deduced from the Scnlla gene (see AAF30103) isolated from a mouse trigemical ganglia cDNA. The sequence shows 68% similarity to human NaN (see AAB20121). NaN belongs to the a subunit voltage-gated sodium channels underlie the generation and propagation of impulses in sexcitable cells such as neurons and muscle fibres. Preferential expression of NaN on sensory neurons innervating the body (dorsal root ganglia) and the face (trigeminal ganglia), but not on other neurons, makes it a very useful target for diagnostic and/or therapeutic uses in relation to acute and/or chronic pain pathologies. A claimed method of treating pain, paraesthesia and/or hyperexcitability phenomena in a human or animal subject involves administering an agent that alters sodium current flow through NaN channels, or which modulates transcription or translation of NaN mRNA, in dorsal root ganglia or trigeminal curons. NaN polypeptides can be obtained by recombinant expression, and used to treat disorders associated with decreased sodium channel expression, to screen for compounds that modulate subject useful as diagnostic agents.

The present sequence is that of novel human tetrodotoxin resistant sodium channel NaN, as deduced from a CDNA clone (see AAP3010) isolated from human dorsal root ganglia tissue. NaN belongs to the a-subunit, voltage-gated sodium channel protein family. It produces a TTX-R sodium current. Such channels underlie the generation and propagation of impulses in excitable cells such as neurons and muscle fibres. Preferential expression of NaN on sensory neurons innervating the body (dorsal root ganglia) and the face (trigeminal signalia), but not on other neurons, makes it a very useful target for diagnostic and/or therapeutic uses in relation to acute and/or chronic pain pathologies. A claimed method of treating pain, animal subject involves administering an agent that alters sodium current flow through NaN channels, or which modulates transcription or translation of NaN mRNA, in dorsal root ganglia or trigeminal neurons. NaN polypeptides can be obtained by recombinant expression, to screen for compounds that modulate sodium channel.
                                                                                                                         1737
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression or activity. and to raise antibodies useful as diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sodium

```

This protein comprises the human hHI voltage-regulated sodium channel protein that can be used in a novel system for enhancing cardiac dignal sensing by cardiac pacemakers through genetic treatment. A claimed system for delivering genetic material (GM) comprises a reservoir containing GM and a device for delivering it comprises a reservoir containing GM and a device for delivering it to myocardial cells (MC) at a specific location. The GM increases the amplitude of the cardiac signal, improving the signal-to-noise (S/N) ratio that is sensed by the electrode of a pacemaker. Also claimed are: (I) an implantable delivery system comprising a cardiac for delivering this through a catheter, the tip of MC and system for delivering this through a catheter, the tip of MC and system for delivering this through a catheter, the tip of MC and system for a pacing electrode on an inner wall of the heart, close to the site where the GM is delivered. The system is used atrial and ventricular MC and improves the sensing of cardiac signals by the pacemaker and the S/N ratio of atrial p-waves. The preferred GM comprises DNA (see AAV09029) or RNA encoding hHI.

for delivering genetic material to heart - comprises oir, catheter and optionally pacing electrode for delivering nnel protein, useful for, e.g. improving sensing by pacemaker

The present sequence is that of the claimed delF1617 mutant of the human SCN5A protein. The mutant is encoded by an SCN5A mutant gene carrying a deletion of the TTC codon for Phe-1617. Mutations of the SCN5A gene are implicated in Romano-Ward syndrome, the autosomal dominant form of Long QT syndrome (LQTS). Mutations newly discovered in the SCN5A gene lead to the following amino acid alterations in the encoded protein: D11144, L1501V, delF1617, R1623L, E1784K and S1787N. Knowledge of the mutations provides means for assessing a risk in a human subject for LQTS, for diagnosing a mutation which causes LQTS, and for screening for drugs useful in treating a human having a mutation in the SCNAA gene. Setul the present sequence is not shown in the specification but is derived from the KVLQT-1 sequence given in the Sequence Listing $\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\times}\overset{\mathrm{M}}{\overset{\mathrm{M}}{\overset{\mathrm{M}}}{\overset{\mathrm$

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New KVLQT1 and SCN5A genes, which contains alterations or mutations, useful in diagnostic/prognostic or drug screening methods, particularly in mutational analyses for screening individuals with or at risk for
                                                       The present sequence is that of the protein encoded by the human SCN5A gene. This gene is implicated in Romano-Ward syndrome, the autosomal dominant form of Long OT syndrome (LOTS). Novel mutations have been identified in the gene using single strand conformation polymorphism analysis. These result in the following amino acid alterations: Dilatvi, LEGUY, delFi617, R1631L, EDT84K and S1787N. Isolated human polymorphides comprising such a mutation (see AAB82240-45) are claimed. Knowledge of the mutations provides means for assessing a risk in a human subject for LOTS, for diagnosing a mutation which causes LQTS, and for screening for drugs useful in treating a human having a mutation in the SCN5A gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NFRPFTSDSLAAIKKRIAIQKER----KKSKDKAAAEPQPRPQLDLKASRKLPKLYGDI 69

```
The present sequence is that of the claimed D1114N mutant of the human SCN5A protein. The mutant is encoded by an SCN5A mutant of the gene in which a G/A mutation allers codon 1114 from GAC to AAC.

Mutations of the SCN5A gene are implicated in Romano-Ward syndrome, the autosomal dominant form of Long OT syndrome (LQTS). Mutations of the SCN5A gene lead to the following amino acid alterations in the encoded protein: D1114N, L1501V, delF1517, R1623L, E1784K and S1787N. Knowledge of the mutations provides can assessing a risk in a human subject for LQTS, for diagnosing a mutation which causes LQTS, and for screening for drugs useful in treating a human having a mutation in the SCN5A gene.

Wote: The present sequence is not shown in the specification but is derived from the KVLQT-1 sequence given in the Sequence Listing (see AABB2220).
                                                                                                                                                                                                                                                                 New KVLQT1 and SCN5A genes, which contains alterations or mutations, useful in diagnostic/prognostic or drug screening methods, particularly in mutational analyses for screening individuals with or at risk for

Claim 31; Page -; 76pp; English.

The present sequence is that of the claimed S1787N mutant of the human SCNSA protein. The mutant is encoded by an SCNSA mutant of the mutant in which a G/A mutation alters codon 1787 from AGT to AAT. Mutations of the SCNSA gene are implicated in Romano-Ward syndrome, the autosomal dominant form of Long QT syndrome (LQTS). Mutations

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       838
newly discovered in the SCN5A gene lead to the following amino acid alterations in the encoded protein: D1114N, L1501V, delF1617, R1623L, E1784K and S1787N. Knowledge of the mutations provides means for assessing a risk in a human subject for LOTS, for diagnosing a mutation which causes LQTS, and for screening for drugs useful in treating a human having a mutation in the SCN5A gene. Note: The present sequence is not shown in the specification but is derived from the KVLQT-1 sequence given in the Sequence Listing (see AAB82220).
                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of the claimed L1501V mutant of the human SCN5A protein. The mutant is encoded by an SCN5A mutant of mutanties coden 1501 from CTG to GTG.

Gene in which a C/G mutation alters coden 1501 from CTG to GTG.

Mutations of the SCN5A gene are implicated in Roomano-Ward syndrome, the autosomal dominant form of Long QT syndrome (LQTS). Mutations callerations in the encoded protein: D114M, L1501V, delF1617, R1621L, E1784K and S1787N. Knowledge of the mutations provides means for assessing a risk in a human subject for LQTS, for diagnosing a mutation which causes LQTS, and for screening for drugs useful in treating a human having a mutation in the SCN5A gene.

Note: The present sequence is not shown in the Sequence Listing derived from the KVLQT-1 sequence given in the Sequence Listing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   eful in diagnostic/prognostic or drug screening methods, particularly mutational analyses for screening individuals with or at risk for

eful in diagnostic/prognostic or drug screening methods, particularly mutational analyses for screening individuals with or at risk for or mutations, Claim 31; Page -; 76pp; English. QT syndrome long

The present sequence is that of the claimed E1784K mutant of the human SCN5A protein. The mutant is encoded by an SCN5A mutant gene in which a G/A mutation alters codon 1784 from GAG to AAG. Mutations of the SCN5A gene are implicated in Romano-Ward syndrome, the autosomal dominant form of Long OT syndrome (LOTS). Mutations newly discovered in the SCN5A gene lead to the following amino acid alterations in the encoded protein: D1114N, L1501V, delP1617, CR1621L, E1784K and S1787N. Knowledge of the mutations provides means for assessing a risk in a human subject for LQTS, for drugs useful in treating a human having a mutation in the SCN5A gene. CR pote: The present sequence is not shown in the specification but is derived from the KVLQT-1 sequence given in the Sequence Listing (see AAB82220).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
